# High-Energy Physics workloads on 10k non-dedicated opportunistic cores with Lobster

Anna Woodard, Matthias Wolf, et.al.

presented by Benjamin Tovar

Cooperative Computing Lab

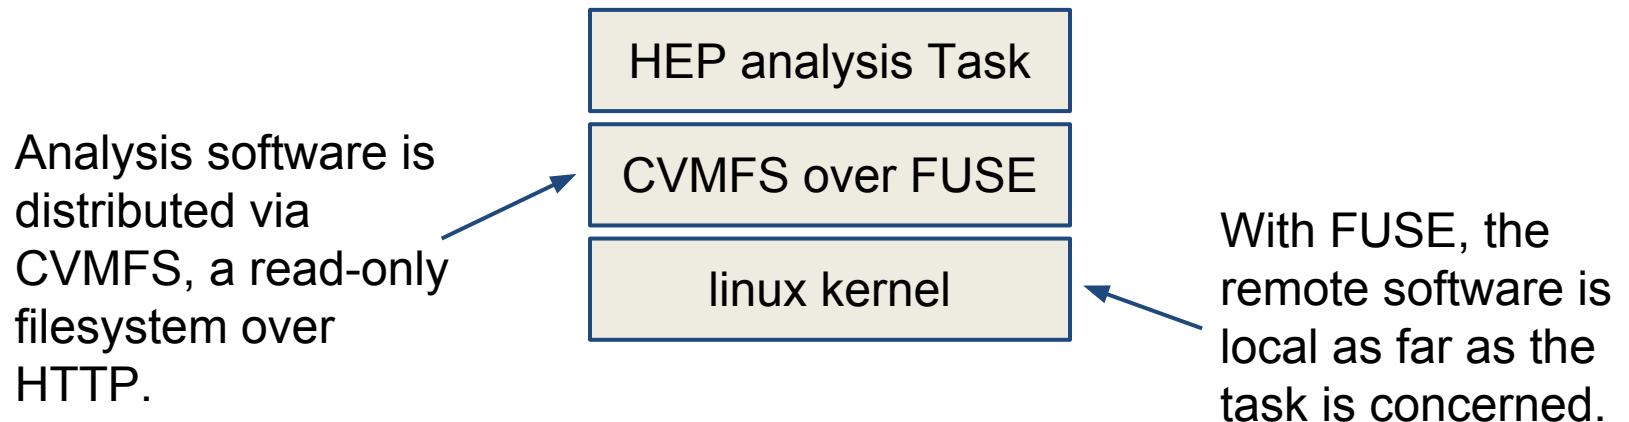

<http://ccl.cse.nd.edu>

---

---

# Analyzing Data from the LHC

The High Energy Physics (HEP) community relies upon a global network of **dedicated** resources to analyze data from the Large Hadron Collider.

---

# Notre Dame's happy opportunistic situation

- ~21k cores at Notre Dame's Center for Research Computing (CRC)
  - They belong to different individual PIs, but they are available through **condor** when not used by their owners.
-

## Notre Dame Condor Status

# from dedicated to opportunistic

Tasks running on opportunistic resources should be prepared for constant eviction.

A FUSE module requires installation by the system administrator.

The biggest hurdle when going opportunistic.

For efficiency with several tasks running on the same node, CVMFS caches files.

If we are not careful, our bandwidth and disk space are no more...

# preview of the results

---

ND CMS + CCTools + libCVMFS + CRC = Lobster

Lobster is a system for deploying data  
intensive high-throughput application  
on non-dedicated resources

---

---

# from dedicated to opportunistic

1. How a task may access CVMFS resources?
  2. How can several tasks efficiently access the same data on a node?
  3. How tasks can be sent to a computational node and managed?
  4. How should tasks be decomposed to efficiently deal with eviction?
  5. How the results of several tasks should be synthesized?
-

---

# CCTools Philosophy

- Harness all the resources that are available: desktops, clusters, clouds, and grids.
  - Make it easy to scale up from one desktop to national scale infrastructure.
  - Provide familiar interfaces that make it easy to connect existing apps together.
  - Allow portability across operating systems, storage systems, middleware...
  - **No special privileges required.**
-

---

# A Quick Tour of the CCTools

- Open source, GNU General Public License.
  - Compiles in 1-2 minutes, installs in \$HOME.
  - Runs on Linux, Solaris, MacOS, Cygwin, FreeBSD, ...
  - Interoperates with many distributed computing systems.
    - Condor, SGE, Torque, Globus, iRODS, Hadoop...
  - Components:
    - **Work Queue**      A lightweight distributed execution system.
    - **Parrot**            A personal user-level virtual file system.
    - Makeflow            A portable workflow manager.
    - Chirp                A user-level distributed filesystem.
-

  2. How can several tasks efficiently access the same data on a node?
  3. How tasks can be sent to a computational node and managed?
  4. How should tasks be decomposed to efficiently deal with eviction?
  5. How the results of several tasks should be synthesized?
-

---

# How a task may access CERN resources?

We use **parrot**

Parrot intercepts system calls and transforms them according to the requested service:

```
% parrot_run vi /anonftp/ftp.gnu.org/pub/README
```

```
% parrot_run ls /cvmfs/cms.cern.ch
```

---

---

# parrot's dream use

parrot\_run

a whole, unmodified  
workflow

---

# parrot's practical use

a whole workflow

parrot\_run

parrot\_run

parrot\_run

**parrot** has to mimic the kernel and de facto behaviour of glibc. It is a good way to discover the skeletons in the closet of the kernel, and thus it is better to restrict its use.

  3. How tasks can be sent to a computational node and managed?
  4. How should tasks be decomposed to efficiently deal with eviction?
  5. How the results of several tasks should be synthesized?
-

---

# How can several tasks efficiently access the same data on a node?

We use **pilot jobs** (called **workers**) with condor, and libcvmfs' **alien cache** with parrot.

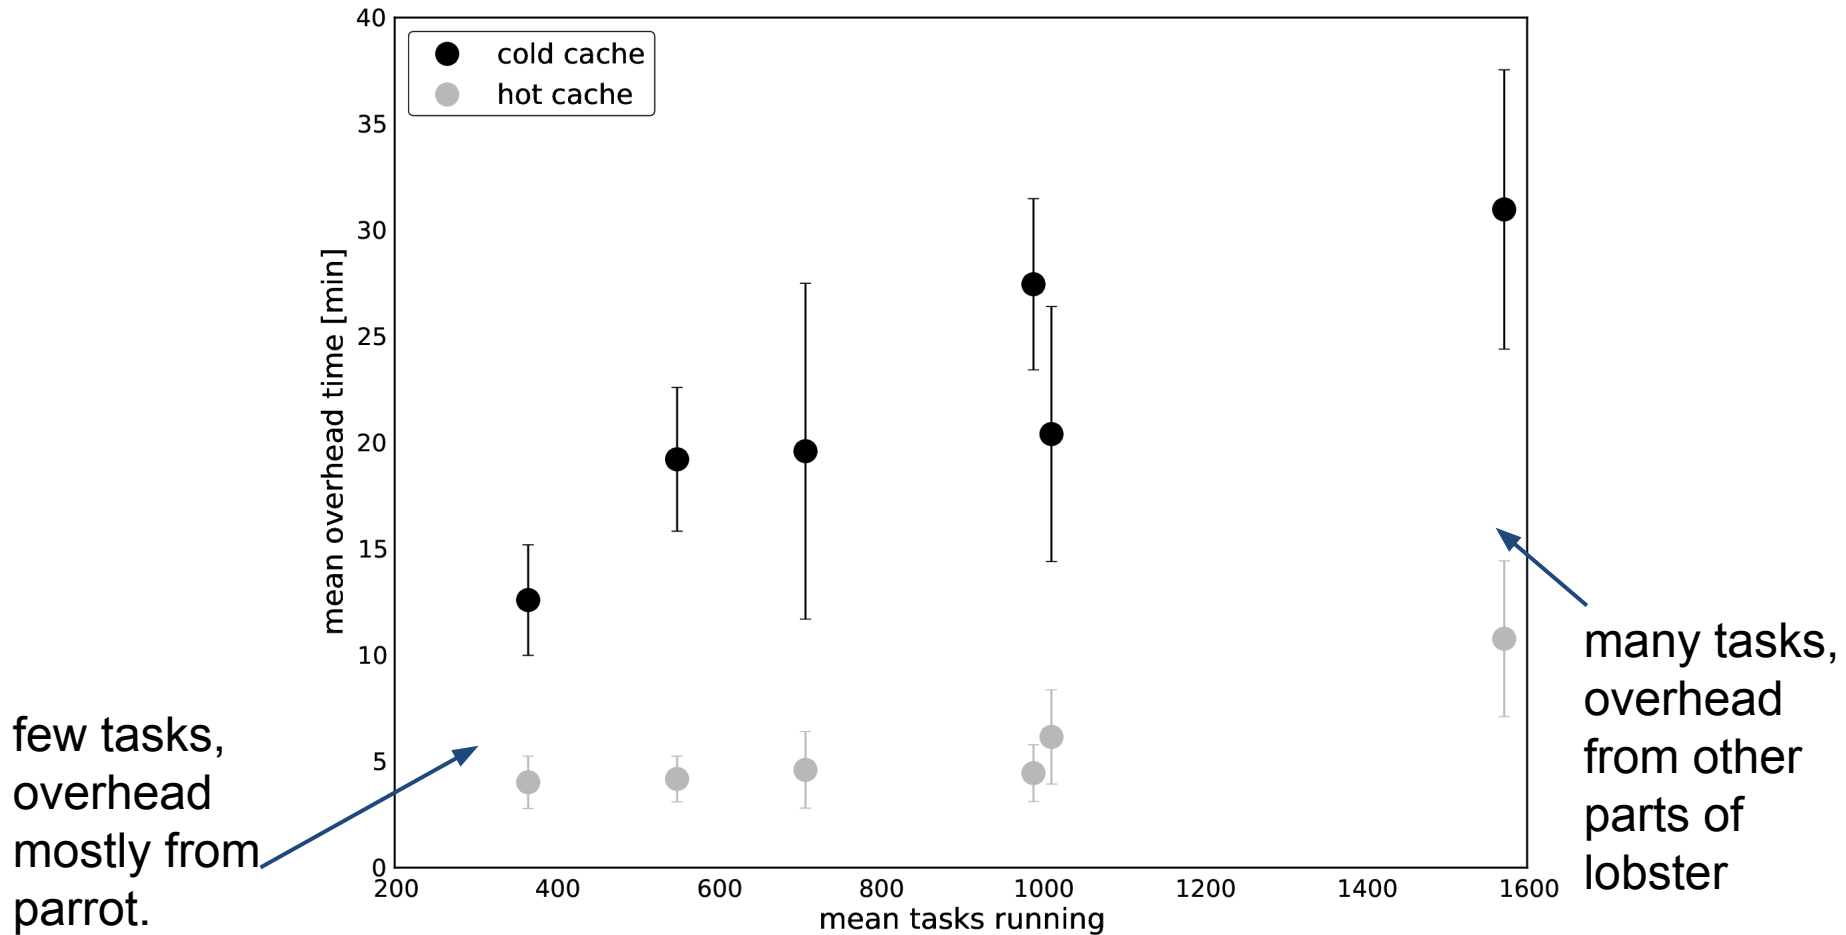

# Measuring overheads

(a maximum of 4 tasks per worker/condor job)

# Measuring overheads

  4. How should tasks be decomposed to efficiently deal with eviction?
  5. How the results of several tasks should be synthesized?
-

# How tasks can be sent to a computational node?

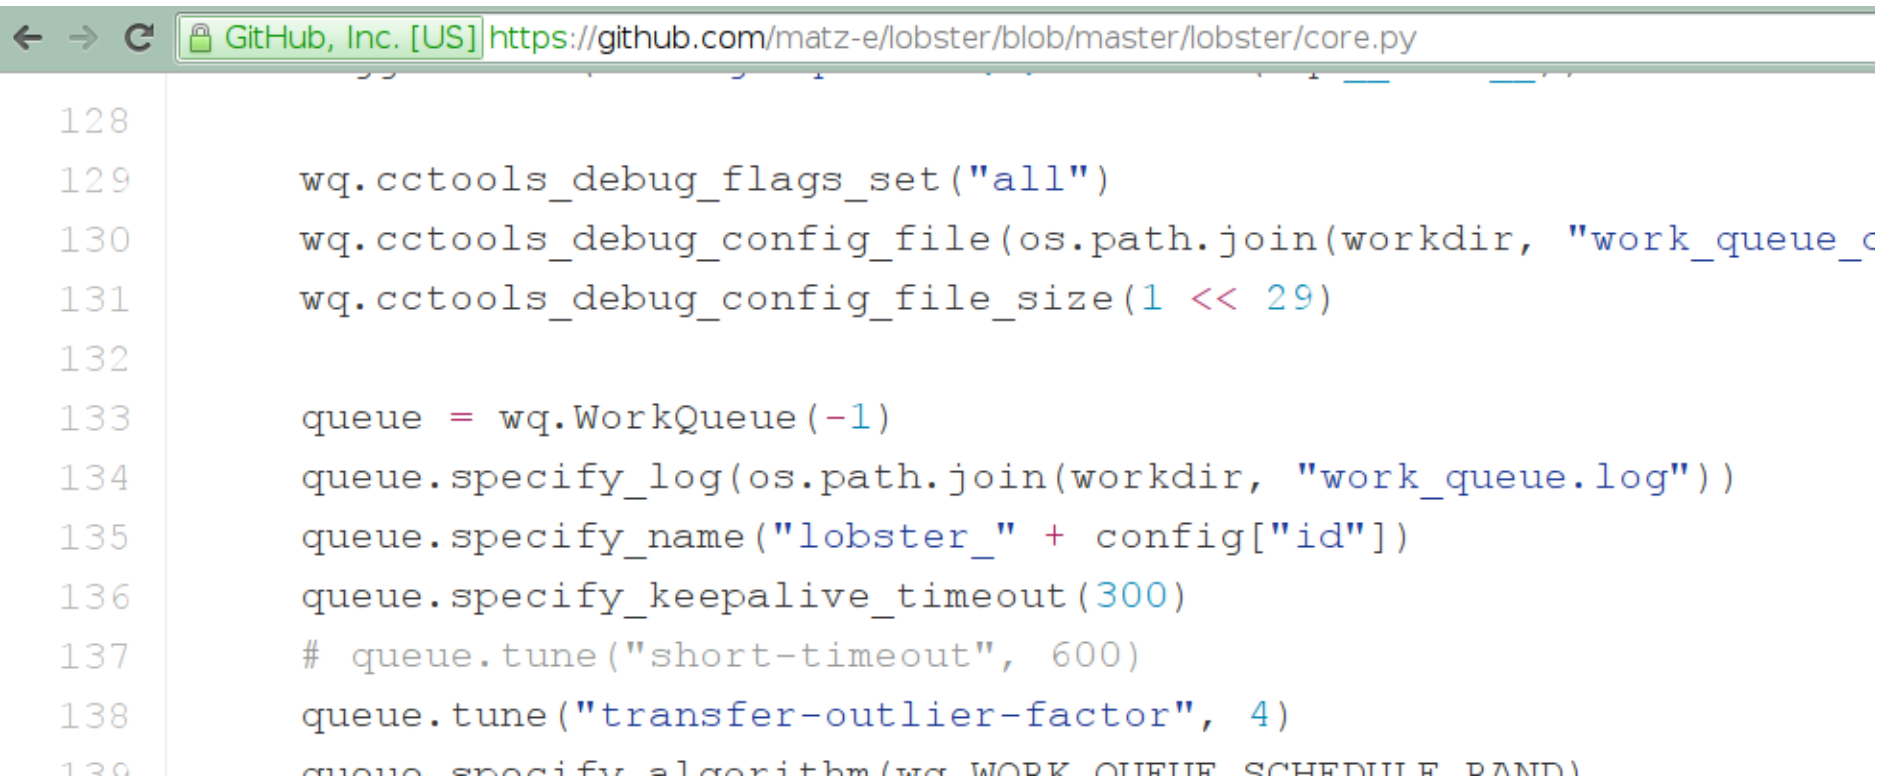

We use Work Queue, a master-worker lightweight execution system part of CCTools.

---

# The Lobster master

The master is written using Work Queue's python bindings.

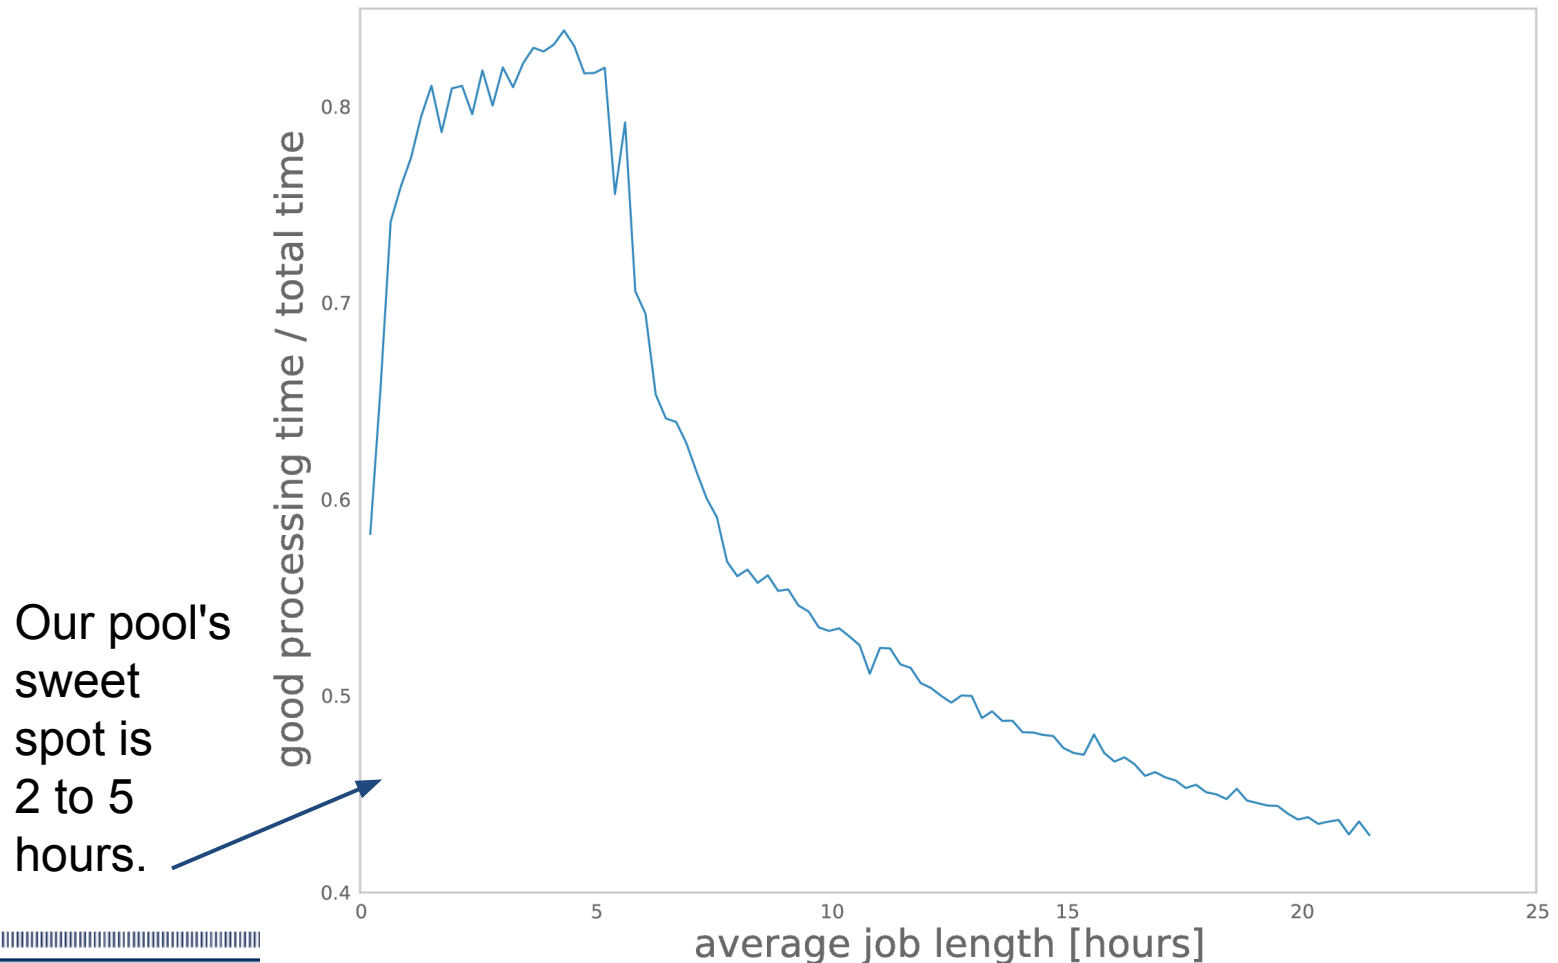

```
128
129     wq.cctools_debug_flags_set("all")
130     wq.cctools_debug_config_file(os.path.join(workdir, "work_queue_c
131     wq.cctools_debug_config_file_size(1 << 29)
132
133     queue = wq.WorkQueue(-1)
134     queue.specify_log(os.path.join(workdir, "work_queue.log"))
135     queue.specify_name("lobster_" + config["id"])
136     queue.specify_keepalive_timeout(300)
137     # queue.tune("short-timeout", 600)
138     queue.tune("transfer-outlier-factor", 4)
139     queue.specify_algorithm(WQ_WORK_QUEUE_SCHEDULE_BAND)
```

# the whole lobster enchilada

Phase	Time (hours)	Fraction (%)
Processing CPU	171036	53.4
Other Non-CPU	65356	20.4
Failed jobs	44830	14.0
WQ startup	22056	6.9
WQ Output transfer wait	8954	2.8
Total	320462	

about 20 CPU  
years in two days.

# bottlenecks

current bottleneck for O(10k) is bandwidth

next bottleneck for O(20k) is the squid proxy servers

---

# summary

- Lobster is designed to run millions of data intensive tasks on tens of thousands of non-dedicated cores over a time scale of weeks.
  - Every component runs with a minimum of privilege.
  - A single user has available performance comparable to a whole Tier 2 site.
    - Running on the scale of 10k cores.
    - 9 gigabits/s input.
    - 150 gigabits/s output.
-

# docker, condor and auto-builds

Problem: Some environment variables use backslash + newline to construct a long command and some environment variables include escape sequences (e.g., PS1="\u@\h \w\\$"). The 'read' command, without the '-r' option, uses backslash as an escape character, causing PS1="\u@\h \w\\$" to be PS1="\u@h w\$". The '-r' option of 'read' disables this but introduces a new problem - The long commands constructed through backslashes will be split into multiple lines. Solution: 'env -O   while read -r -d " " line; do ...' output line with NUL, not new line; -d option of 'read' sets NUL as the delimiter.
