

New Directions and HTCondor @ BNL

USATLAS TIER-3 & NEW COMPUTING DIRECTIVES

William Strecker-Kellogg
RHIC/ATLAS Computing Facility (RACF)
Brookhaven National Lab
May 2016

RACF Overview

2

- ▶ RHIC—Collider at BNL
 - ▶ STAR+PHENIX detectors
 - ▶ ~15000 slots each
 - ▶ ~6Pb central Disk (GPFS/NFS)
 - ▶ ~16Pb Distributed Disk (dCache/xrootd)
 - ▶ ~60Pb HPSS Tape
- ▶ USATLAS T1
 - ▶ ~15kCores
 - ▶ ~11Pb Replicated dCache Disk
 - ▶ ~20Pb HPSS Tape
- ▶ 3 Large HTCondor clusters
 - ▶ Share resources via flocking
 - ▶ Several Smaller clusters
 - ▶ Recent 8.2→8.4 update

ATLAS Load Balancing

- ▶ Working steadily since [last year's talk](#), and [HEPIX Fall 2015 talk](#)
- ▶ Allows occupancy to remain at 95% or above despite dynamically changing workload with no human intervention
- ▶ Prevents starvation due to competition with larger jobs
 - ▶ Only inefficiency is due to (de)fragmentation

V8.4 Bug Fixing

- ▶ Minor issue with classad not appearing in the negotiation context
 - ▶ RemoteGroupResourcesInUse
 - ▶ In context of group-based preemption
 - ▶ Fixed quickly by Greg
- ▶ Ticket #[5593](#)
- ▶ Major issue with Schedd halting for up to an hour
 - ▶ No disk/network IO of any kind
 - ▶ No syscalls
 - ▶ GDB shows a mess (STL)
- ▶ Ticket #[5648](#)

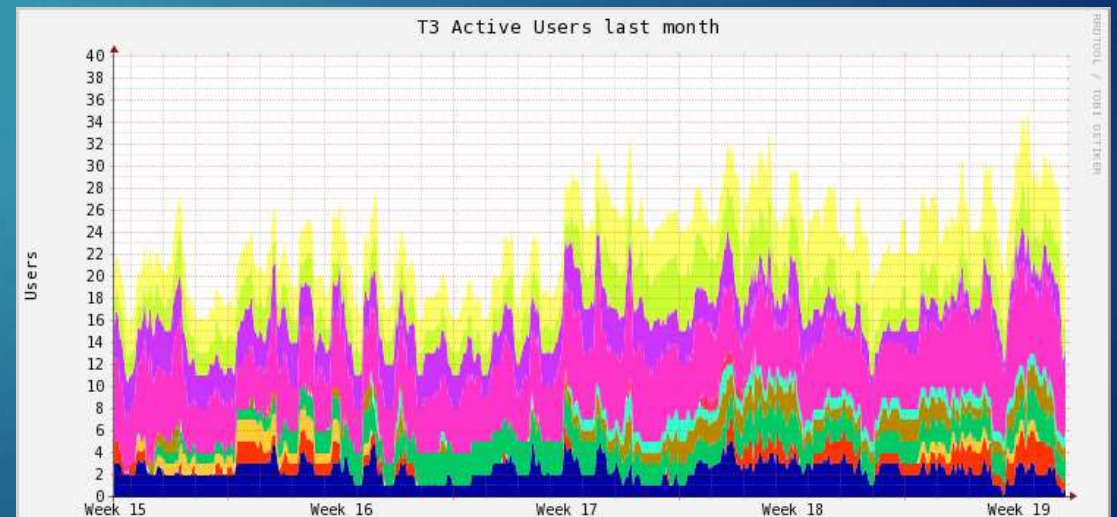

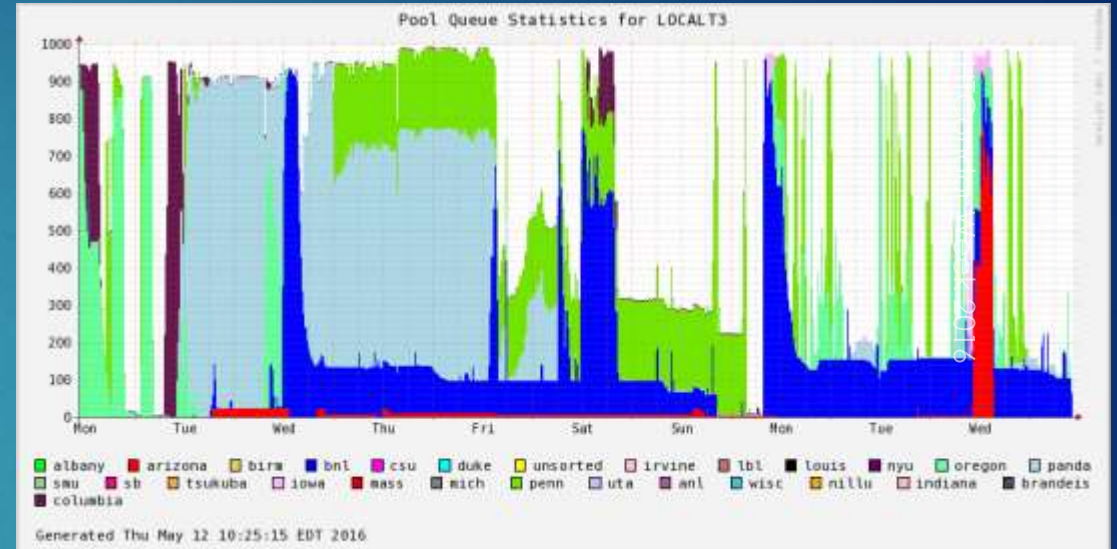

V8.4 Schedd Bug

- ▶ Schedd spending up to an hour recomputing internal array using autocluster→jobid and the reverse mapping
- ▶ Jobs would die after their shadows couldn't talk to their schedd that went dark
- ▶ After day of debugging, code fix was implemented
 - ▶ Built & tested at BNL, max time reduced from 1h to 2s
 - ▶ Thank you to Todd & TJ
- ▶ Still suspect something off in our environment (500k ac/day)
 - ▶ Not a problem anymore!

USATLAS Tier-3 @ BNL

6

- ▶ Consolidates previously scattered Tier-3 facilities
- ▶ Shared resource ~1000 cores
- ▶ Many user-groups represented
 - ▶ Local submission
 - ▶ Hierarchical Group Quotas
 - ▶ Group-Membership authorization problem
 - ▶ Surplus sharing
 - ▶ Group-based fair-share preemption
- ▶ After slow start, increased usage in past few months

Group Membership

7

1 users		SUNY Albany	albany	group_atlas.albany
1 users		Argonne National Laboratory	anl	group_atlas.anl
3 users		University of Arizona	arizona	group_atlas.arizona
1 users		University of Birmingham	birm	group_atlas.birm
34 users		Brookhaven National Laboratory	bnl	group_atlas.bnl
1 users		Brandeis University	brandeis	group_atlas.brandeis
1 users		Columbia University	columbia	group_atlas.columbia
1 users		California State	csu	group_atlas.csu
4 users		Duke University	duke	group_atlas.duke
1 users		Generic or Unknown Institute	general	group_atlas.general
1 users		Indiana University	indiana	group_atlas.indiana
1 users		UC Irvine	irvine	group_atlas.irvine
1 users		Lawrence Berkeley National Lab	lbl	group_atlas.lbl
1 users		Louisville	louis	group_atlas.louis
<input type="checkbox"/>		Northern Illinois University	nillu	group_atlas.nillu
3 users		New York University	nyu	group_atlas.nyu
4 users		University of Oregon	oregon	group_atlas.oregon

- ▶ Extended group-quota editing web UI
 - ▶ Added user-institute-group mappings
 - ▶ Cron generates a config fragment that asserts Owner → Group in START expression
 - ▶ Require group at submission
- ▶ Currently 74 users and 26 groups use the T3
- ▶ Surplus sharing & group-respecting preemption
 - ▶ RemoteGroupResourcesInUse

Preemptable Partitionable Slots

- ▶ Users are frequently asking to run high-memory jobs...
- ▶ ...which motivates: User-prio preemption with partitionable slots
 - ▶ Absolutely need to support group-constrained fair-share with preemption
 - ▶ Currently Pslot Preemption operates on entire slot
 - ▶ Entire group's quota can fit on one 40-core machine
 - ▶ A function of the small scale of having 30+ groups sharing 1000 cores
 - ▶ No way to respect group quotas as schedd splits slots
- ▶ Not Currently Possible!

New Directions

WHAT WE TALK ABOUT WHEN WE TALK ABOUT

H[TP]C

New Science & Evolving Needs

10

HTCondor Week 2016

Traditional Model

- ▶ RACF as a microcosm of HEP/NP computing
 - ▶ Many other facilities of a similar (within an order of magnitude) scale and capability
 - ▶ Embarrassingly parallel workloads
- ▶ Data storage as large or larger a problem than computing
- ▶ Batch is simple—provisioning/matchmaking vs. scheduling
- ▶ Large, persistent, well-staffed experiments

New Model

- ▶ New Users with traditionally HPC-based workloads
 - ▶ National Synchrotron Lightsource II
 - ▶ Center for Functional Nanomaterials
- ▶ Revolving userbase
 - ▶ No institutional “repository” of computing knowledge
 - ▶ Not used to large-scale computing
- ▶ Software support not well-defined
 - ▶ Large pool of poorly supported open source or free/abandon-ware
 - ▶ Commercial or GUI-Interactive

Institutional Cluster

- ▶ New cluster of 108 nodes, each with 2xGPUs
 - ▶ Plans to increase next year by a factor of 2, then perhaps more
- ▶ Infiniband interconnect in fat-tree topology
- ▶ SLURM is being evaluated
 - ▶ Seems to be the growing choice for new HPC clusters
 - ▶ Active Development
 - ▶ DOE experience
 - ▶ Open Source
 - ▶ Large userbase (6 of top 10 of TOP500)
 - ▶ Test sample workloads in proposed queue configurations
 - ▶ Set up [Shifter](#) for docker intergration
- ▶ Will be run as a “traditional” HPC cluster
 - ▶ MPI support an important consideration

New Science & Evolving Needs

12

HTCondor Week 2016

- ▶ Lab-management support for consolidation of computing
- ▶ Computational Science Initiative (CSI) at BNL “leverages” experience at RACF in support of other non-HEP/NP science domains
- ▶ CSI is also organizing software support to fill a gap in current BNL computational services

...

- ▶ The \$10,000 question:

Can we leverage existing infrastructure?

Running at HTC Facility

13

HTCCondor Week 2016

Zero-Order Requirements

- ▶ Embarrassingly Parallel
 - ▶ (small) Input → (one) Process → (small) Output
 - ▶ No communication of intermediate results
- ▶ X86_64
 - ▶ Other hardware not standard in the community
- ▶ Data accessible
 - ▶ May seem obvious, but need adequate bandwidth to get data to the compute and back
 - ▶ Something to think about of moving from single desktop

Running at HTC Facility

14

HTCCondor Week 2016

First-Order Requirements

- ▶ Linux (RedHat)
 - ▶ Virtualization is an extra complexity, Windows expensive
 - ▶ Containers / Docker allows simple cross-linux compatibility
- ▶ Free Software
 - ▶ Instance-limited licenses are hard to control across many pools
 - ▶ Cost of licenses becomes prohibitive with exponential computing growth
- ▶ “Friendly” resource profile
 - ▶ Code runs not just within the machine, but within the general limits its neighboring jobs use

HTC/HPC Divide

15

HTCCondor Week 2016

- ▶ Not a false dichotomy, but surely an increasingly blurry line
 - ▶ Several users in our experience fit in middle-ground (albeit with considerable help from the RACF to fit workload into an exclusive HTC environment)
 1. Biology Group: 800 cores for 5 months simple dedicated scheduler
 2. Wisconsin group at CFN: successfully ran opportunistically on RHIC resources
- ▶ Key factors
 - ▶ How much state transfer and with what IO patterns?
 - ▶ Size
 - ▶ 10 years to now: 2 racks collapse into 1 machine
 - ▶ How many problems fit inside one machine today?

Scheduling

- ▶ HTCondor recently can submit to SLURM via grid universe
- ▶ Different sharing models
 1. Condor-as-SLURM-job (glidein-style)
 2. Coexist, mutually exclude via policy
 3. Flocking/Routing (needs work for our users)
- ▶ Ideal: transparent for users who know the requirements of their workload

The End

THANK YOU FOR YOUR TIME!
